

Equivalence Semantics of CCS

Moonzoo Kim
School of Computing
KAIST

- Trace Equivalence
- Observational Trace Equivalence
- Bisimulation Equivalence
- Observational Bisimulation Equivalence
- May Preorder and Must Preorder
- Example
- Usage of Concurrent Workbench

- Sys is a **design** for buffer with separated input/output ports

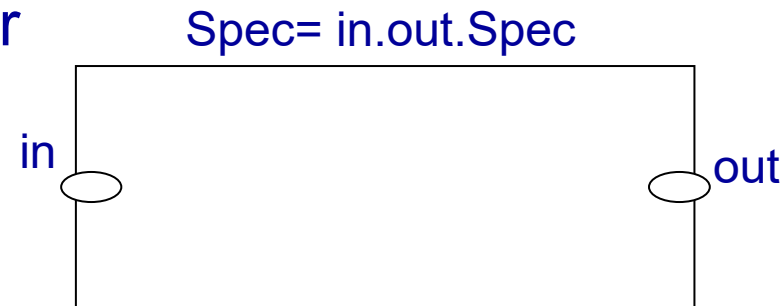

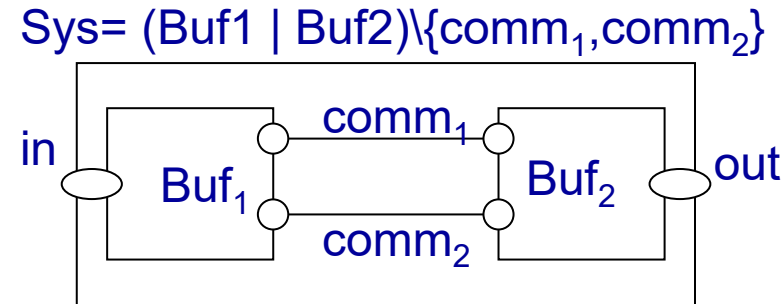

$$\begin{aligned} \text{Sys} &= (\text{Buf}_1 \mid \text{Buf}_2) \setminus \{\text{comm}_1, \text{comm}_2\} \\ &\bullet \text{Buf}_1 = \text{in}.\text{comm}_1' . \text{Buf}_1', \text{Buf}_1' = \text{comm}_2 . \text{Buf}_1 \\ &\bullet \text{Buf}_2 = \text{comm}_1 . \text{Buf}_2', \text{Buf}_2' = \text{out}' . \text{comm}_2' . \text{Buf}_2 \end{aligned}$$

- Spec is a **requirement** for the buffer design

$$\text{Spec} = \text{in} . \text{Spec}', \text{Spec}' = \text{out}' . \text{Spec}$$

- Question: $\text{Sys} == \text{Spec}$?

- ✦ Let us consider **trace equivalence** (i.e. language equivalence) $=_T$
 - $T(P) = \{ s \in \text{Act}^* \mid s \text{ is an execution trace of } P \}$
 - $P =_T Q$ iff $T(P) = T(Q)$

Observational Trace Equivalence

■ $\text{Sys} =_{\tau} \text{Spec}$?

✚ No. Sys has τ which Spec does not

- $T(\text{Sys}) = \{\text{in}, \text{in}.\tau, \text{in}.\tau.\text{out}', \text{in}.\tau.\text{out}'.\tau, \dots\}$
- $T(\text{Spec}) = \{\text{in}, \text{in}.\text{out}' \dots\}$

✚ Yes. τ is an internal hidden action **not visible outside (not observable)**.

Thus, τ should not be included in an execution

- If $s \in \text{Act}^*$, then $\hat{s} \in (\text{Act} - \{\tau\})^*$ is the action sequence obtained by deleting all occurrences of τ from s .
 - Ex> $s = a.\tau.b.\tau.c$, then $\hat{s} = a.b.c$
- A set of **observable** execution traces: $T'(P) = \{\hat{s} \mid s \in T(P)\}$
- $P =_{\text{OT}} Q$ iff $T'(P) = T'(Q)$
- $\text{Sys} =_{\text{OT}} \text{Spec}$ because $T'(\text{Sys}) = \{\text{in}, \text{in}.\text{out}', \dots\}$, $T'(\text{Spec}) = \{\text{in}, \text{in}.\text{out}', \dots\}$

$\text{Sys} = (\text{Buf}_1 | \text{Buf}_2) \setminus \{\text{comm}_1, \text{comm}_2\}$

Importance of Branching Behavior

*Which vending machine do you prefer?
 $p?$ $q?$ $r?$*

Bisimulation Equivalence

■ $P =_{BS} Q$ iff for all $\alpha \in \text{Act}$

- ✦ Whenever $P \xrightarrow{\alpha} P'$, then for some Q' , $Q \xrightarrow{\alpha} Q'$ and $P' =_{BS} Q'$
- ✦ Whenever $Q \xrightarrow{\alpha} Q'$, then for some P' , $P \xrightarrow{\alpha} P'$ and $P' =_{BS} Q'$

■ Note

- ✦ $=_{BS}$ is an equivalence relation (reflexive, transitive, symmetric)
- ✦ $P =_{BS} Q$ implies $P =_T Q$, but **not vice versa**

■ Example>

- ✦ $C_0 = b'.C_1 + a.C_2$, $C_1 = a.C_3$, $C_2 = b'.C_3$, $C_3 = b'.C_1 + a.C_2$
- ✦ $D_0 = b'.D_1 + a.D_2$, $D_1 = a.D_0$, $D_2 = b'.D_0$
- ✦ A binary relation R proves that $C_0 =_{BS} D_0$
 - $R = \{(C_0, D_0), (C_1, D_1), (C_2, D_2), (C_3, D_0)\}$

Observational Bisimulation Equivalence

- We cannot simply ignore τ for observational bisimulation equivalence. Thus, we define a new observational transition $=_{\alpha} \Rightarrow$
- $P =_{\text{OBS}} Q$ iff for all $\alpha \in \text{Act}$
 - ✦ Whenever $P =_{\alpha} \Rightarrow P'$, then for some Q' , $Q =_{\alpha} \Rightarrow Q'$ and $P' =_{\text{OBS}} Q'$
 - ✦ Whenever $Q =_{\alpha} \Rightarrow Q'$, then for some P' , $P =_{\alpha} \Rightarrow P'$ and $P' =_{\text{OBS}} Q'$
- $P =_{\alpha} \Rightarrow Q$ iff $P \xrightarrow{(-\tau \rightarrow)^*} \alpha \rightarrow \xrightarrow{(-\tau \rightarrow)^*} Q$ where $\alpha \in \text{Act} - \{\tau\}$
 - ✦ Let $s \in (\text{Act} - \{\tau\})^*$. Then $q =_s \Rightarrow q'$ if there exists s' s.t. $q \xrightarrow{s'} \Rightarrow q'$ and $s = \hat{s}'$
 - ✦ $P = a.P + b.P$, $Q1 = a.Q1 + \tau.Q2$, $Q2 = b.Q1$
 - Suppose that 'a' means pushing button 'a'. Similarly for 'b'
 - P always allows a user to push any buttons.
 - Q1 allows a user to push button 'a' sometimes, button 'b' sometimes.
 - Thus, we need to distinguish P from Q1 (P and Q1 are **not observationally bisimilar**), which can be done using $=_{\alpha} \Rightarrow$ instead of $-\alpha \rightarrow$
 - $Q1 \xrightarrow{a} Q1$ implies $Q1 =_a \Rightarrow Q1$. Similarly $Q2 \xrightarrow{b} Q1$ implies $Q2 =_b \Rightarrow Q1$
 - $Q1 \xrightarrow{a} Q1 \xrightarrow{\tau} Q2$ implies $Q1 =_a \Rightarrow Q2$. $Q2 \xrightarrow{b} Q1 \xrightarrow{\tau} Q2$ implies $Q2 =_b \Rightarrow Q2$

Observational Bisimulation Equivalence (cont)

■ $\text{Sys} =_{\text{BS}} \text{Spec?}$ (see slide 3)

- ✚ No. Sys has τ which Spec does not (i.e. not strongly bisimilar)

■ $\text{Sys} =_{\text{OBS}} \text{Spec?}$

- ✚ Yes. Sys is **observationally bismilar** to Spec
 - Proof: $R = \{ (s0, \text{Spec}), (s1, \text{Spec}'), (s3, \text{Spec}), (s2, \text{Spec}') \}$
 - $s0 \xrightarrow{\text{in}} s1$ implies $s0 = \text{in} \Rightarrow s1$. Similarly, $s2 \xrightarrow{\text{out}} s3$ implies $s2 = \text{out} \Rightarrow s3$
 - $s0 \xrightarrow{\text{in}} s1 \xrightarrow{\tau} s2$ implies $s0 = \text{in} \Rightarrow s2$.
 - $s2 \xrightarrow{\text{out}} s3 \xrightarrow{\tau} s0$ implies $s2 = \text{out} \Rightarrow s0$
