

# Equivalence Semantics of CCS

*Moonzoo Kim*  
*CS Dept. KAIST*

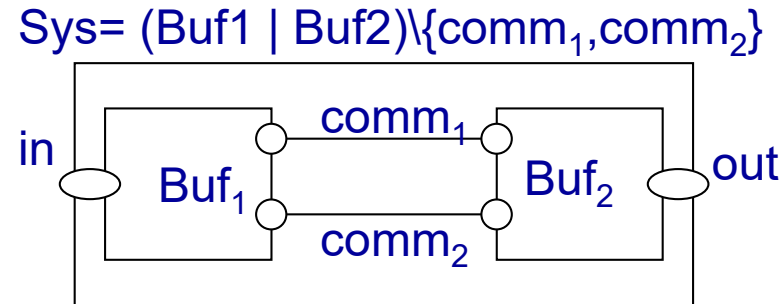

- Trace Equivalence
- Observational Trace Equivalence
- Bisimulation Equivalence
- Observational Bisimulation Equivalence
- May Preorder and Must Preorder
- Example
- Usage of Concurrent Workbench

- Sys is a **design** for buffer with separated input/output ports

$$\begin{aligned} \text{Sys} &= (\text{Buf}_1 \mid \text{Buf}_2) \setminus \{\text{comm}_1, \text{comm}_2\} \\ &\bullet \text{Buf}_1 = \text{in}.\text{comm}_1' . \text{Buf}_1', \text{Buf}_1' = \text{comm}_2 . \text{Buf}_1 \\ &\bullet \text{Buf}_2 = \text{comm}_1 . \text{Buf}_2', \text{Buf}_2' = \text{out}' . \text{comm}_2' . \text{Buf}_2 \end{aligned}$$

- Spec is a **requirement** for the buffer design

$$\text{Spec} = \text{in} . \text{Spec}', \text{Spec}' = \text{out}' . \text{Spec}$$

- Question:  $\text{Sys} == \text{Spec}$ ?

- Let us consider **trace equivalence** (i.e. language equivalence)  $=_T$ 
  - $T(P) = \{s \in \text{Act}^* \mid s \text{ is an execution trace of } P\}$
  - $P =_T Q$  iff  $T(P) = T(Q)$

# Observational Trace Equivalence

## ■ $\text{Sys} =_{\tau} \text{Spec}$ ?

✚ No.  $\text{Sys}$  has  $\tau$  which  $\text{Spec}$  does not

- $T(\text{Sys}) = \{\text{in}, \text{in}.\tau, \text{in}.\tau.\text{out}', \text{in}.\tau.\text{out}'.\tau, \dots\}$
- $T(\text{Spec}) = \{\text{in}, \text{in}.\text{out}' \dots\}$

$$\begin{aligned} \text{Sys} &= (\text{Buf1} \mid \text{Buf2}) \setminus \{\text{comm1}, \text{comm2}\} \\ \text{Buf1} &= \text{in}.\text{comm1}.\text{Buf1}', \quad \text{Buf1}' = \text{comm2}.\text{Buf1} \\ \text{Buf2} &= \text{comm1}'.\text{Buf2}', \quad \text{Buf2}' = \text{out}.\text{comm2}'.\text{Buf2} \\ \text{Spec} &= \text{in}.\text{out}.\text{Spec} \end{aligned}$$

✚ Yes.  $\tau$  is an internal hidden action **not visible outside (not observable)**.

Thus,  $\tau$  should not be included in an execution

- If  $s \in \text{Act}^*$ , then  $\hat{s} \in (\text{Act} - \{\tau\})^*$  is the action sequence obtained by deleting all occurrences of  $\tau$  from  $s$ .
  - Ex>  $s = a.\tau.b.\tau.c$ , then  $\hat{s} = a.b.c$
- A set of **observable** execution traces:  $T'(P) = \{\hat{s} \mid s \in T(P)\}$
- $P =_{\text{OT}} Q$  iff  $T'(P) = T'(Q)$
- $\text{Sys} =_{\text{OT}} \text{Spec}$  because  $T'(\text{Sys}) = \{\text{in}, \text{in}.\text{out}', \dots\}$ ,  $T'(\text{Spec}) = \{\text{in}, \text{in}.\text{out}', \dots\}$

# Bisimulation Equivalence

■  $P =_{BS} Q$  iff for all  $\alpha \in \text{Act}$

✚ Whenever  $P \xrightarrow{\alpha} P'$ , then for some  $Q'$ ,  $Q \xrightarrow{\alpha} Q'$  and  $P' =_{BS} Q'$

✚ Whenever  $Q \xrightarrow{\alpha} Q'$ , then for some  $P'$ ,  $P \xrightarrow{\alpha} P'$  and  $P' =_{BS} Q'$

■ Note

✚  $=_{BS}$  is an equivalence relation (reflexive, transitive, symmetric)

✚  $P =_{BS} Q$  implies  $P =_T Q$ , but **not vice versa**

■ Example>

✚  $C_0 = b'.C_1 + a.C_2$ ,  $C_1 = a.C_3$ ,  $C_2 = b'.C_3$ ,  $C_3 = b'.C_1 + a.C_2$

✚  $D_0 = b'.D_1 + a.D_2$ ,  $D_1 = a.D_0$ ,  $D_2 = b'.D_0$

✚ A binary relation  $R$  proves that  $C_0 =_{BS} D_0$

•  $R = \{(C_0, D_0), (C_1, D_1), (C_2, D_2), (C_3, D_0)\}$

# Observational Bisimulation Equivalence

- We cannot simply ignore  $\tau$  for observational bisimulation equivalence. Thus, we define a new observational transition  $=_{\alpha} \Rightarrow$
- $P =_{\text{OBS}} Q$  iff for all  $\alpha \in \text{Act}$ 
  - ✚ Whenever  $P =_{\alpha} \Rightarrow P'$ , then for some  $Q'$ ,  $Q =_{\alpha} \Rightarrow Q'$  and  $P' =_{\text{OBS}} Q'$
  - ✚ Whenever  $Q =_{\alpha} \Rightarrow Q'$ , then for some  $P'$ ,  $P =_{\alpha} \Rightarrow P'$  and  $P' =_{\text{OBS}} Q'$
- $P =_{\alpha} \Rightarrow Q$  iff  $P \xrightarrow{(-\tau \rightarrow)^*} \alpha \rightarrow \xrightarrow{(-\tau \rightarrow)^*} Q$  where  $\alpha \in \text{Act} - \{\tau\}$ 
  - ✚ Let  $s \in (\text{Act} - \{\tau\})^*$ . Then  $q =_s \Rightarrow q'$  if there exists  $s'$  s.t.  $q \xrightarrow{s'} \Rightarrow q'$  and  $s = \hat{s}'$
  - ✚  $P = a.P + b.P$ ,  $Q1 = a.Q1 + \tau.Q2$ ,  $Q2 = b.Q1$ 
    - Suppose that 'a' means pushing button 'a'. Similarly for 'b'
      - P always allows a user to push any buttons.
      - Q1 allows a user to push button 'a' sometimes, button 'b' sometimes.
    - Thus, we need to distinguish P from Q1 (P and Q1 are **not observationally bisimilar**), which can be done using  $=_{\alpha} \Rightarrow$  instead of  $-\alpha \rightarrow$ 
      - $Q1 \xrightarrow{a} Q1$  implies  $Q1 =_a \Rightarrow Q1$ . Similarly  $Q2 \xrightarrow{b} Q1$  implies  $Q2 =_b \Rightarrow Q1$
      - $Q1 \xrightarrow{a} Q1 \xrightarrow{\tau} Q2$  implies  $Q1 =_a \Rightarrow Q2$ .  $Q2 \xrightarrow{b} Q1 \xrightarrow{\tau} Q2$  implies  $Q2 =_b \Rightarrow Q2$

# Observational Bisimulation Equivalence (cont)

## ■ $\text{Sys} =_{\text{BS}} \text{Spec?}$ (see slide 3)

- ✚ No. Sys has  $\tau$  which Spec does not (i.e. not strongly bisimilar)

## ■ $\text{Sys} =_{\text{OBS}} \text{Spec?}$

- ✚ Yes. Sys is **observationally bismilar** to Spec
  - Proof:  $R = \{ (s0, \text{Spec}), (s1, \text{Spec}'), (s3, \text{Spec}), (s2, \text{Spec}') \}$ 
    - $s0 \text{ --in--> } s1$  implies  $s0 = \text{in} \Rightarrow s1$ . Similarly,  $s2 \text{ --out--> } s3$  implies  $s2 = \text{out} \Rightarrow s3$
    - $s0 \text{ --in--> } s1 \text{ --}\tau\text{--> } s2$  implies  $s0 = \text{in} \Rightarrow s2$ .
    - $s2 \text{ --out--> } s3 \text{ --}\tau\text{--> } s0$  implies  $s2 = \text{out} \Rightarrow s0$
